任务和解决方案
Task and Solution

任务

重工业对所用部件的可靠性和使用寿命提出了很高的要求。经验表明，仍在许多工业工厂中使用的用于超速保护的机械式超速开关不满足安全、准确和可靠性方面的所有要求。例如，这些装置通常表现出低的抗冲击和抗振动的能力，有限的切断精度，以及在低的切断速度时需要增速齿轮箱。

Task

Heavy industry places tough demands on the reliability and service life of the utilized components. Experience shows that mechanical overspeed switches, which are still used in many industrial plants for overspeed protection purposes do not fulfil all requirements with regard to safety, accuracy and reliability. For instance, these devices often exhibit low resistance to shock and vibration, limited switching accuracy as well as requiring speed increasing gear for low switching speeds.

功能 Function

集成速度传感器由带有光电扫描的脉冲盘组成，产生与速度成比例的频率。

这是由逻辑模块(MCU)处理。当前速度与存储在非易失性存储器(NVRAM)中的程序限制速度连续比较。

当达到限速时，逻辑单元触发相应的开关（开关打开）。

The integrated speed sensor consists of a pulse disk with optical scanner and generates a frequency proportional to the speed.

This is processed by the logic module (MCU). The current speed is continuously compared with the programmed limit speeds stored in the nonvolatile memory (NVRAM).

The logic unit triggers the corresponding switch when a limit speed is reached (switch opens).

编程软件 (EGS 40 / 41) Programming software (EGS 40 / 41)
