任务和解决方案  
Task and Solution

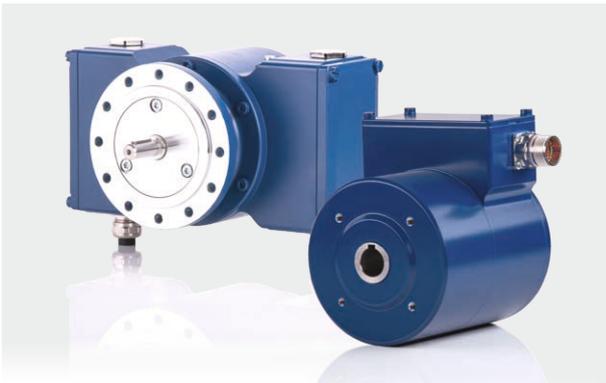

### 任务

重工业对所用部件的可靠性和寿命提出了苛刻的要求。这尤其适用于安装用于测量和监测速度的增量编码器。无论它们是安装在钢厂、轧钢、采矿作业、起重机系统或石油天然气工业的驱动器上，每个应用领域都有自己的特点：从不同的安装方案和扩展选项到不同的脉冲数、辅助信号输出、集成FOC变频器，到不锈钢外壳或特殊认证，如功能安全的SIL/PL认证和潜在爆炸性环境的ATEX/IECEX的认证。我们面临的挑战是为每个任务和每个安装位置提供量身定制的解决方案，并保证每个解决方案的可靠性。

### Task

Heavy industry places tough demands on the reliability and lifetime of the components utilized. That applies in particular to incremental encoders installed to measure and monitor speeds. No matter if they are installed on drives in steel and rolling mills, in mining operations, in crane systems or in the oil and gas industry, each field of application has its own specifications: from different mounting solutions and extension options to different pulse rates, supplementary signal outputs, integrated FOC transmitters through to stainless steel housings or special certifications such as SIL / PL for functional safety and ATEX / IECEx for potentially explosive atmospheres. The challenge is to provide a tailor-made solution for each task and every mounting situation – and to guarantee the reliability of each and every solution.

集成速度传感器由带有光学扫描仪的脉冲盘组成，产生与速度成比例的频率。

这是由逻辑模块（MCU）处理的。当前速度与存储在非易失性存储器（NVRAM）中的编程极限速度进行连续比较。当达到极限速度时，逻辑单元触发相应的开关（开关打开）。

The integrated speed sensor consists of a pulse disk with optical scanner and generates a frequency proportional to the speed.

This is processed by the logic module (MCU). The current speed is continuously compared with the programmed limit speeds stored in the nonvolatile memory (NVRAM). The logic unit triggers the corresponding switch when a limit speed is reached (switch opens).
